

General Description

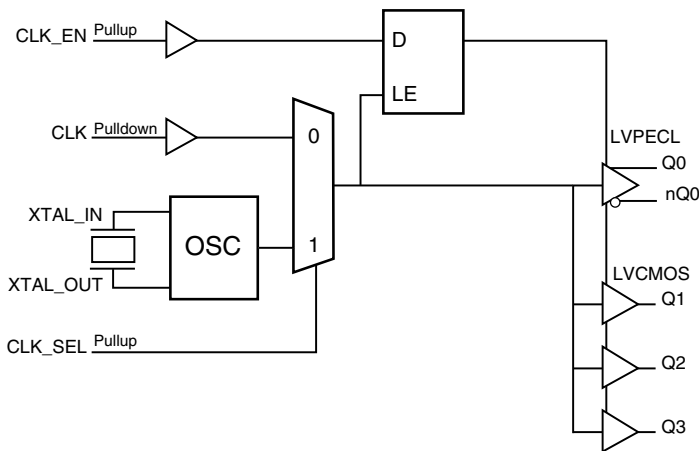

The ICS8534I-13 is a low skew, high performance 1-to-4 Crystal Oscillator/LVCMOS-to-3.3V, 2.5V LVPECL/LVCMOS fanout buffer. The ICS8534I-13 has selectable single-ended clock or crystal inputs. The single-ended clock input accepts LVCMOS or LVTTTL input levels and translate them to 3.3V LVPECL levels. The output enable is internally synchronized to eliminate runt pulses on the outputs during asynchronous assertion/deassertion of the clock enable pin.

Guaranteed output and part-to-part skew characteristics make the ICS8534I-13 ideal for those applications demanding well defined performance and repeatability.

Features

- One differential LVPECL output, and three single-ended LVCMOS outputs
- Selectable LVCMOS/LVTTTL CLK or crystal inputs
- CLK can accept the following input levels: LVCMOS, LVTTTL
- Crystal frequency range: 12MHz – 40MHz
- Maximum output frequency: 266MHz
- Propagation delay: 2.1ns (maximum), 3.3V LVPECL output
- Additive phase jitter, RMS: 0.221ps (typical), 3.3V LVPECL output
- Full 3.3V or 2.5V operating supply
- -40°C to 85°C ambient operating temperature
- Lead-free (RoHS 6) packaging

Pin Description and Pin Characteristic Tables

Table 1. Pin Descriptions

Number	Name	Type		Description
1	CLK_EN	Input	Pullup	Synchronizing clock enable. When HIGH, clock outputs follows clock input. When LOW, Q outputs are forced low, nQ0 output is forced high. LVCMOS / LVTTTL interface levels.
2, 3	XTAL_IN, XTAL_OUT	Input		Crystal oscillator interface. XTAL_IN is the input. XTAL_OUT is the output.
4	V _{CC}	Power		Positive supply pin.
5	CLK	Input	Pulldown	Clock input. LVCMOS / LVTTTL interface levels.
6	CLK_SEL	Input	Pullup	Clock select input. When HIGH, selects XTAL inputs. When LOW, selects CLK input. LVCMOS / LVTTTL interface levels.
7, 12	V _{EE}	Power		Negative supply pins.
8	V _{CCO_LVPECL}	Power		Output power supply mode for LVPECL clock outputs.
9, 10	Q0, nQ0	Output		Differential clock outputs. LVPECL interface levels.
11	nc	Unused		No connect.
13, 15, 16	Q1, Q2, Q3	Output		Single ended clock outputs. LVCMOS / LVTTTL interface levels.
14	V _{CCO_LVCMOS}	Power		Output power supply mode for LVCMOS / LVTTTL clock outputs.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance	Crystal Not Included		4		pF
C _{PD}	Power Dissipation Capacitance (per output)	Q[1:3] V _{CC} , V _{CC_LVCMOS} = 3.465V		8		pF
		V _{CC} , V _{CC_LVCMOS} = 2.625V		5		pF
R _{PULUP}	Input Pullup Resistor			51		kΩ
R _{PULLDOWN}	Input Pulldown Resistor			51		kΩ
R _{OUT}	Output Impedance	Q[1:3] V _{CC} , V _{CC_LVCMOS} = 3.465V		15		Ω
		V _{CC} , V _{CC_LVCMOS} = 2.625V		20		Ω

Function Tables

Table 3A. Control Input Function Table

Inputs			Outputs		
CLK_EN	CLK_SEL	Selected Source	Q0	nQ0	Q[1:3]
0	0	CLK	Disabled; LOW	Disabled; HIGH	Disabled; LOW
0	1	XTAL_IN, XTAL_OUT	Disabled; LOW	Disabled; HIGH	Disabled; LOW
1	0	CLK	Enabled	Enabled	Enabled
1	1	XTAL_IN, XTAL_OUT	Enabled	Enabled	Enabled

NOTE: After CLK_EN switches, the clock outputs are disabled or enabled following a rising and falling input clock or crystal oscillator edge as shown in Figure 1.

NOTE: In the active mode, the state of the outputs are a function of the CLK input as described in Table 3B.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{CC}	4.6V
Inputs, V_I (LVCMOS)	-0.5V to $V_{CC} + 0.5V$
Outputs, V_O (LVCMOS)	-0.5V to $V_{CCO_LVCMOS} + 0.5V$
Inputs, V_I (LVPECL)	-0.5V to $V_{CC} + 0.5V$
Outputs, I_O (LVPECL) Continuous Current Surge Current	50mA 100mA
Package Thermal Impedance, θ_{JA}	76°C/W (0 mps)

Applications Information

Recommendations for Unused Input and Output Pins

Inputs:

Crystal Inputs

For applications not requiring the use of the crystal oscillator input, both XTAL_IN and XTAL_OUT can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from XTAL_IN to ground.

CLK Inputs

For applications not requiring the use of the clock input, it can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from CLK to ground.

LVCMOS Control Pins

All control pins have internal pullup resistors; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

Crystal Input Interface

The ICS8534I-13 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz, 18pF parallel resonant crystal and were chosen to minimize the ppm error. These same capacitor values will tune any 18pF parallel resonant crystal over the frequency range and other parameters specified in this data sheet. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

Outputs:

LVCMOS Outputs

All unused LVCMOS outputs can be left floating. There should be no trace attached.

LVPECL Outputs

The unused LVPECL output pair can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

Figure 2. Crystal Input Interface

Overdriving the XTAL Interface

The XTAL_IN input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The XTAL_OUT pin can be left floating. The amplitude of the input signal should be between 500mV and 1.8V and the slew rate should not be less than 0.2V/ns. For 3.3V LVCMOS inputs, the amplitude must be reduced from full swing to at least half the swing in order to prevent signal interference with the power rail and to reduce internal noise. *Figure 3A* shows an example of the interface diagram for a high speed 3.3V LVCMOS driver. This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This

can be done in one of two ways. First, R_1 and R_2 in parallel should equal the transmission line impedance. For most 50 Ω applications, R_1 and R_2 can be 100 Ω . This can also be accomplished by removing R_1 and changing R_2 to 50 Ω . The values of the resistors can be increased to reduce the loading for a slower and weaker LVCMOS driver. *Figure 3B* shows an example of the interface diagram for an LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XTAL_IN input. It is recommended that all components in the schematics be placed in the layout. Though some components might not be used, they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input.

Figure 3A. General Diagram for LVCMOS Driver to XTAL Input Interface

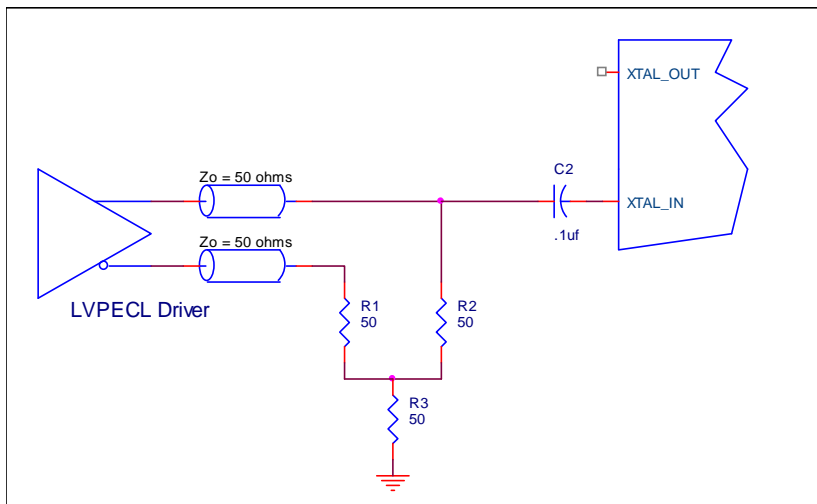

Figure 3B. General Diagram for LVPECL Driver to XTAL Input Interface

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential output is a low impedance follower output that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for

functionality. These outputs are designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 4A. 3.3V LVPECL Output Termination

Figure 4B. 3.3V LVPECL Output Termination

Termination for 2.5V LVPECL Outputs

Figure 5A and Figure 5B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{CC0} - 2V$. For $V_{CC0} = 2.5V$, the $V_{CC0} - 2V$ is very close to

-LVCMOS ground level. The R3 in Figure 5B can be eliminated and the termination is shown in Figure 5C.

Figure 5A. 2.5V LVPECL Driver Termination Example

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS8534I-13. Equations and example calculations are also provided.

1. Power Dissipation

The total power dissipation for the ICS8534I-13 is the sum of the core power plus the power dissipated due to loading.

The following is the power dissipation for $V_{CC} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated due to loading.

Core and LVPECL Output Power Dissipation

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.465V * 65mA = 225.225mW$
- Power (outputs)_{MAX} = **30mW/Loaded Output pair**
If all outputs are loaded, the total power is $1 * 30mW = 30mW$

LVCMOS Output Power Dissipation

- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{CCO_LVCMOS}/2$
Output Current $I_{OUT} = V_{CCO_MAX} / [2 * (50\Omega + R_{OUT})] = 3.465V / [2 * (50\Omega + 15\Omega)] = 26.7mA$
- Power Dissipation on the R_{OUT} per LVCMOS output
Power (R_{OUT}) = $R_{OUT} * (I_{OUT})^2 = 15\Omega * (26.7mA)^2 = 10.7mW$ per output
- Total Power Dissipation on the R_{OUT}
Total Power (R_{OUT}) = $10.7mW * 3 = 32.1mW$

Total Power Dissipation

- Total Power**
= LVPECL Power (core)_{MAX} + LVPECL Power (outputs)_{MAX} + Total Power (R_{OUT})
= $225.225mW + 30mW + 32.1mW$
= $287.325mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is $125^\circ C$. Limiting the internal transistor junction temperature, T_j , to $125^\circ C$ ensures that the bond wire and bond pad temperature remains below $125^\circ C$.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is $76^\circ C/W$ per Table 7 below.

Therefore, T_j for an ambient temperature of $85^\circ C$ with all outputs switching is:

$$85^\circ C + 0.287W * 76^\circ C/W = 106.8^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 16 Lead SOIC, Forced Convection

θ_{JA} by Velocity			
Meters Per Second	0	1	2
Multi-Layer PCB, JEDEC Standard Test Boards	$76.0^\circ C/W$	$69.78^\circ C/W$	$67.49^\circ C/W$

3. Calculations and Equations.

The purpose of this section is to calculate the power dissipation for the LVPECL output pair.

LVPECL output driver circuit and termination are shown in *Figure 6*.

Figure 6. LVPECL Driver Circuit and Termination

To calculate power dissipation per output pair due to loading, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CCO} - 2V$.

$$\begin{aligned} \text{For logic high, } V_{OUT} = V_{OH_MAX} &= V_{CCO_MAX} - 0.9V \\ (V_{CCO_MAX} - V_{OH_MAX}) &= 0.9V \end{aligned}$$

$$\begin{aligned} \text{For logic low, } V_{OUT} = V_{OL_MAX} &= V_{CCO_MAX} - 1.7V \\ (V_{CCO_MAX} - V_{OL_MAX}) &= 1.7V \end{aligned}$$

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$\begin{aligned} Pd_H &= [(V_{OH_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = [(2V - (V_{CCO_MAX} - V_{OH_MAX}))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = \\ & [(2V - 0.9V)/50W] * 0.9V = \mathbf{19.8mW} \end{aligned}$$

$$\begin{aligned} Pd_L &= [(V_{OL_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = [(2V - (V_{CCO_MAX} - V_{OL_MAX}))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = \\ & [(2V - 1.7V)/50W] * 1.7V = \mathbf{10.2mW} \end{aligned}$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = \mathbf{30mW}$$

DISCLAIMER Integrated Device Technology, Inc. (IDT) and its subsidiaries reserve the right to modify the products and/or specifications described herein at any time and at IDT's sole discretion. All information in this document, including descriptions of product features and performance, is subject to change without notice. Performance specifications and the operating parameters of the described products are determined in the independent state and are not guaranteed to perform the same way when installed in customer products. The information contained herein is provided without representation or warranty of any kind, whether express or implied, including, but not limited to, the suitability of IDT's products for any particular purpose, an implied warranty of merchantability, or non-infringement of the intellectual property rights of others. This document is presented only as a guide and does not convey any license under intellectual property rights of IDT or any third parties.

IDT's products are not intended for use in applications involving extreme environmental conditions or in life support systems or similar devices where the failure or malfunction of an IDT product can be reasonably expected to significantly affect the health or safety of users. Anyone using an IDT product in such a manner does so at their own risk, absent an express, written agreement by IDT.

Integrated Device Technology, IDT and the IDT logo are registered trademarks of IDT. Other trademarks and service marks used herein, including protected names, logos and designs, are the property of IDT or their respective third party owners.
