

NCS6415DWEVB

NCS6415 Evaluation Board Manual

ON Semiconductor®

<http://onsemi.com>

Description

This document describes NCS6415 SOIC-20WB package evaluation board. It should be used in conjunction with the data sheet, which contains full technical details on the device specification and operation. This evaluation board is offered as a convenience for the customers interested in performing their own engineering characterization and performance assessment. The evaluation board provides a 75 Ω controlled impedance environment. The evaluation board is designed to facilitate a quick evaluation of the device.

This evaluation board manual contains information on NCS6415DEVB: Evaluation Board for NCS6415 Video Switch.

Board Layout

The SOIC-20WB package evaluation board is implemented in four layers (Figure 1, Evaluation Board

Layup). The first layer contains the device and other components. The second layer is the copper ground plane. The third layer is the power plane. The fourth layer is the soldering side for through-hole components.

Board Design (NCS6415DWEVB)

The evaluation board contains 8 inputs and 6 outputs (See Figure 2). The input contains termination resistor (typically 75 Ω for video application). The evaluation board contains an external transistor to drive a typical 150 Ω video load (75 Ω is series to the output). There are two power supplies voltages that can be provided on this board (one for the device and the other for the external drivers). For testing convenience, a jumper is provided to short the two power supplies on the board, if only one power supply is available.
