## Ultra-small 2-Channel 45 mΩ/2 A Power Switch with Reverse-Current Blocking

# SLG59M1639V

### General Description

The SLG59M1639V is a dual-channel, 45 mΩ PMOS power switch designed to switch 1.5 to 5 V power rails up to 2A in each channel. When either channel is enabled, reverse-current protection will quickly open the switch in the event of a reverse-voltage condition is detected (a  $V_{OUT} > V_{IN} + 50$  mV condition opens the switch). In the event that the channel's VIN voltage is too low, the power switch also contains an internal UVLO threshold monitor to keep or to turn the switch OFF. Each power switch is independently controlled via its own low-voltage compatible CMOS input.

Designed to operate over a  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  range, the SLG59M1639V is available in a RoHS-compliant, ultra-small 1.6 x 1.0 mm STDFN package.

### Pin Configuration

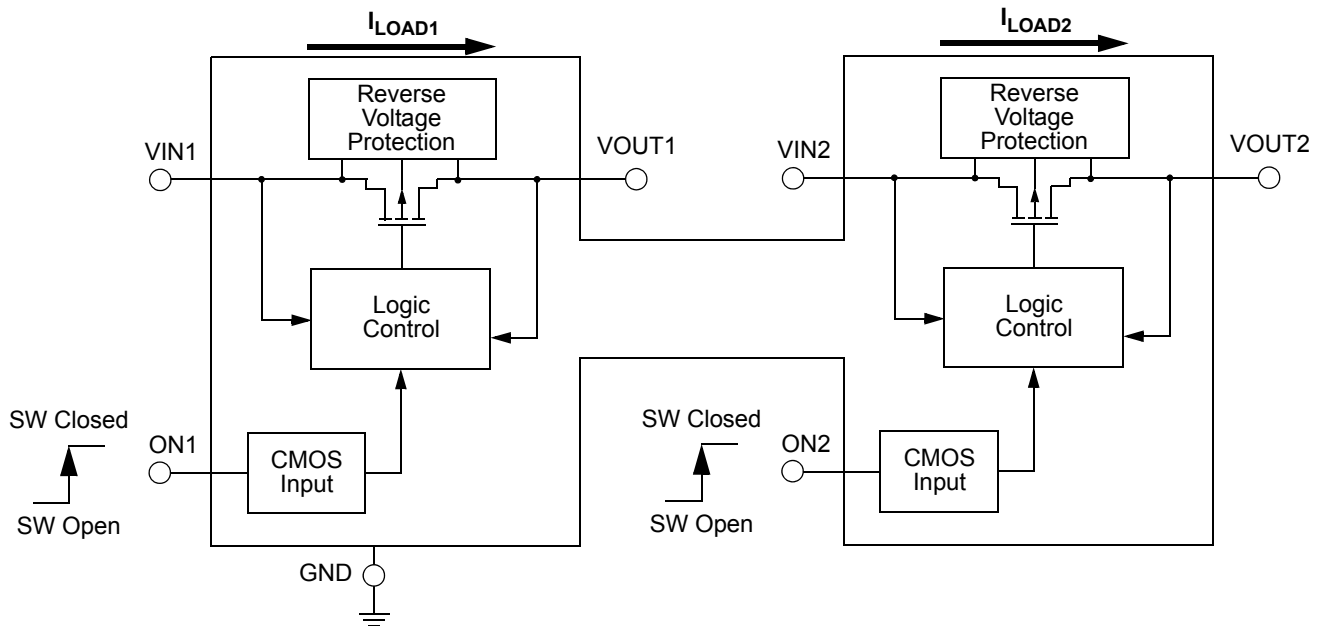

### Features

- Integrated 2-Channel PMOS Power Switch
- 2 A Maximum Continuous Switch Current per Channel
- Low Typical  $R_{DS(ON)}$ :
  - 45 mΩ at  $V_{IN} = 5$  V
  - 60 mΩ at  $V_{IN} = 2.5$  V
  - 80 mΩ at  $V_{IN} = 1.5$  V
- Operating Voltage: 1.5 V to 5.5 V
- Reverse-current/voltage Protection
- Low-voltage CMOS Logic Compatible Switch Control
- Operating temperature range:  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Pb-Free / Halogen-Free / RoHS compliant packaging

### Applications

- Power-Rail Switching:
  - Notebook/Laptop/Tablet PCs
  - Smartphones/Wireless Handsets
  - High-definition Digital Cameras
  - Set-top Boxes
- Point of Sales Pins
- GPS Navigation Devices

### Block Diagram

### Pin Description

Pin #	Pin Name	Type	Pin Description
1	VIN2	MOSFET	Input and source terminal of MOSFET #2. Bypass the VIN2 pin to GND with a 1 $\mu$ F (or larger), low-ESR capacitor.
2	ON2	Input	ON2 turns Channel 2 MOSFET ON and is a low logic-level CMOS input with $V_{IL} < 0.3$ V and $V_{IH} > 1$ V. As the ON2 input circuit does not have an internal pull-down resistor, connect ON2 pin directly to a GPIO controller – do not allow this pin to be open circuited.
3	ON1	Input	ON1 turns Channel 1 MOSFET ON and is a low-logic level CMOS input with $V_{IL} < 0.3$ V and $V_{IH} > 1$ V. As the ON1 input circuit does not have an internal pull-down resistor, connect ON1 pin directly to a GPIO controller – do not allow this pin to be open circuited.
4	VIN1	MOSFET	Input and source terminal of MOSFET #1. Bypass the VIN1 pin to GND with a 1 $\mu$ F (or larger), low-ESR capacitor.
5	VOUT1	MOSFET	Output and drain terminal of MOSFET #1.
6	NC	No Connect	No connection. Do not make connection to any other pin - leave Pin 6 as an open circuit.
7	GND	GND	Ground connection. Connect this pin to system analog or power ground plane.
8	VOUT2	MOSFET	Output and drain terminal of MOSFET #2.

### Ordering Information

Part Number	Type	Production Flow
SLG59M1639V	STDFN	Industrial, -40 °C to 85 °C
SLG59M1639VTR	STDFN (Tape and Reel)	Industrial, -40 °C to 85 °C

## Absolute Maximum Ratings

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IN}$	Power Supply		-0.3	--	6	V
$T_S$	Storage Temperature		-65	--	150	°C
ESD <sub>HBM</sub>	ESD Protection	Human Body Model	2000	--	--	V
ESD <sub>CDM</sub>	ESD Protection	Charged Device Model	1000	--	--	V
MSL	Moisture Sensitivity Level		1			
$\theta_{JA}$	Thermal Resistance	1.0 x 1.6 mm 8L STDFN	--	82	--	°C/W
$T_{J,MAX}$	Maximum Junction Temperature		--	150	--	°C
MOSFET IDS <sub>CONT</sub>	Continuous Current from VIN to VOUT	Each channel, $T_J < 150^\circ\text{C}$	--	--	2	A
MOSFET IDS <sub>PK</sub>	Peak Current from Drain to Source	Maximum pulsed switch current, pulse width < 1 ms, 1% duty cycle	--	--	2.5	A

Note: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Electrical Characteristics

$1.5\text{ V} \leq V_{IN[1,2]} \leq 5.5\text{ V}$ ;  $C_{IN} = 1\ \mu\text{F}$ ,  $T_A = -40\text{ }^\circ\text{C}$  to  $85\text{ }^\circ\text{C}$ , unless otherwise noted.

Typical values are at  $T_A = 25^\circ\text{C}$  (unless otherwise stated)

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IN[1,2]}$	Switch Input Voltage		1.5	--	5.5	V
$V_{IN(UVLO)}$	VIN Undervoltage Lockout Threshold	$V_{IN} \uparrow$ , $V_{ON} = 0\text{ V}$ , $I_{OUT} = -100\text{ mA}$	--	--	1.2	V
		$V_{IN} \downarrow$ , $V_{ON} = 0\text{ V}$ , $R_{LOAD} = 10\ \Omega$	0.5	--	--	V
$I_{IN}$	Quiescent Supply Current, Both Channels	$V_{IN} = 5.25\text{ V}$ , $V_{ON} = \text{HIGH}$ , $I_{OUT} = 0\text{ mA}$	--	3.5	5.3	$\mu\text{A}$
		$V_{IN} = 1.5\text{ V}$ , $V_{ON} = \text{HIGH}$ , $I_{OUT} = 0\text{ mA}$	--	2.5	4	$\mu\text{A}$
$I_{IN(OFF)}$	OFF Mode Supply Current, Both Channels	$V_{IN} = 5.25\text{ V}$ , $V_{ON} = \text{LOW}$ , $R_{LOAD} = 1\text{ M}\Omega$	--	1	1.5	$\mu\text{A}$
		$V_{IN} = 1.5\text{ V}$ , $V_{ON} = \text{LOW}$ , $R_{LOAD} = 1\text{ M}\Omega$	--	0.4	1.0	$\mu\text{A}$
RDS <sub>ON</sub>	Static Drain to Source ON Resistance	$T_A = 25^\circ\text{C}$ , $V_{IN} = 5.0\text{ V}$ , $I_{LOAD} = -200\text{ mA}$	--	45	55	m $\Omega$
		$T_A = 25^\circ\text{C}$ , $V_{IN} = 2.5\text{ V}$ , $I_{LOAD} = -200\text{ mA}$	--	60	72	m $\Omega$
		$T_A = 25^\circ\text{C}$ , $V_{IN} = 1.5\text{ V}$ , $I_{LOAD} = -200\text{ mA}$	--	80	96	m $\Omega$
$V_{REVERSE}$	Reverse-current Voltage Threshold		--	50	--	mV
$I_{REVERSE}$	Reverse-current Leakage Current after Reverse Current Event	$V_{OUT} - V_{IN} > V_{REVERSE}$ ; $T_A = 25^\circ\text{C}$ ; ON1, ON2 = GND	--	0.6	--	$\mu\text{A}$
$V_{ON[1,2]}$	ON[1,2] Pin Voltage Range		0	--	$V_{IN}$	V
$I_{ON(Leakage)}$	ON[1,2] Pin Leakage Current	$1.4\text{ V} \leq V_{ON} \leq V_{IN}$ or $V_{ON} = \text{GND}$	--	--	1	$\mu\text{A}$
ON_V <sub>IH</sub>	ON[1,2] Pin Input High Voltage		1	--	$V_{DD}$	V
ON_V <sub>IL</sub>	ON[1,2] Pin Input Low Voltage		-0.3	0	0.3	V
ON <sub>HYS</sub>	ON[1,2] Hysteresis		--	60	--	mV

**Electrical Characteristics** (continued)

1.5 V ≤ V<sub>IN[1,2]</sub> ≤ 5.5 V; C<sub>IN</sub> = 1 μF, T<sub>A</sub> = -40 °C to 85 °C, unless otherwise noted.

Typical values are at T<sub>A</sub> = 25 °C (unless otherwise stated)

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit

### RDS<sub>ON</sub> vs. V<sub>IN[1,2]</sub> and Temperature

### RDS<sub>ON</sub> vs. Temperature and V<sub>IN[1,2]</sub>

## V<sub>IN[1,2]</sub> Inrush Current Details

When either channel of the SLG59M1639V is enabled with ON[1,2] ↑, the power switch closes to charge the V<sub>OUT[1,2]</sub> output capacitor to V<sub>IN[1,2]</sub>. The charging current drawn from V<sub>IN[1,2]</sub> is commonly referred to as “VIN inrush current” and can cause the input power source to collapse if the VIN inrush current is too high.

Since the V<sub>OUT[1,2]</sub> rise time of the SLG59M1639V is fixed, V<sub>IN[1,2]</sub> inrush current is then a function of the output capacitance at V<sub>OUT[1,2]</sub>. The expression relating V<sub>IN[1,2]</sub> inrush current, the SLG59M1639V V<sub>OUT[1,2]</sub> rise time, and C<sub>LOAD[1,2]</sub> is:

$$V_{IN[1,2]} \text{ Inrush Current} = C_{LOAD[1,2]} \times \frac{\Delta V_{OUT[1,2]}}{V_{OUT[1,2]} \text{ Rise Time}}$$

where in this expression Δ V<sub>OUT[1,2]</sub> is equivalent to 0.8 x V<sub>IN[1,2]</sub> if the initial SLG59M1639V’s output voltages are zero.

In the table below are examples of V<sub>IN[1,2]</sub> inrush currents assuming zero initial charge on C<sub>LOAD[1,2]</sub> as a function of V<sub>IN[1,2]</sub>.

V <sub>IN[1,2]</sub>	V <sub>OUT[1,2]</sub> Rise Time	C <sub>LOAD[1,2]</sub>	Inrush Current
1.5 V	0.5 μs	0.1 μF	0.25 A
5 V	1 μs	0.1 μF	0.4 A

Since the relationship is linear and if C<sub>LOAD[1,2]</sub> were increased to 1 μF, then the V<sub>IN[1,2]</sub> inrush currents would be 10x higher in either example. If a large C<sub>LOAD[1,2]</sub> capacitor is required in the application and depending upon the strength of the input power source, it may very well be necessary to increase the C<sub>IN</sub>-to-C<sub>LOAD</sub> ratio to minimize VIN[1,2] droop during turn-on.

For other V<sub>OUT[1,2]</sub> rise time options, please contact Silego for additional information.

## Power Dissipation

The junction temperature of the SLG59M1639V depends on factors such as board layout, ambient temperature, external air flow over the package, load current, and the RDS<sub>ON</sub>-generated voltage drop across each power MOSFET. While the primary contributor to the increase in the junction temperature of the SLG59M1639V is the power dissipation of its power MOSFETs, its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$PD_{TOTAL} = (RDS_{ON1} \times I_{OUT1}^2) + (RDS_{ON2} \times I_{OUT2}^2)$$

where:

PD<sub>TOTAL</sub> = Total package power dissipation, in Watts (W)

RDS<sub>ON[1,2]</sub> = Channel 1 and Channel 2 Power MOSFET ON resistance, in Ohms (Ω), respectively

I<sub>OUT[1,2]</sub> = Channel 1 and Channel 2 Output current, in Amps (A), respectively

and

$$T_J = PD_{TOTAL} \times \theta_{JA} + T_A$$

where:

T<sub>J</sub> = Die junction temperature, in Celsius degrees (°C)

θ<sub>JA</sub> = Package thermal resistance, in Celsius degrees per Watt (°C/W) – highly dependent on pcb layout

T<sub>A</sub> = Ambient temperature, in Celsius degrees (°C)

### Power Dissipation (continued)

In nominal operating mode, the SLG59M1639V's power dissipation can also be calculated by taking into account the voltage drop across each switch ( $V_{INx}-V_{OUTx}$ ) and the magnitude of that channel's output current ( $I_{OUTx}$ ):

$$PD_{TOTAL} = [(V_{IN1}-V_{OUT1}) \times I_{OUT1}] + [(V_{IN2}-V_{OUT2}) \times I_{OUT2}] \text{ or}$$

$$PD_{TOTAL} = [(V_{IN1} - (R_{LOAD1} \times I_{OUT1})) \times I_{OUT1}] + [(V_{IN2} - (R_{LOAD2} \times I_{OUT2})) \times I_{OUT2}]$$

where:

$PD_{TOTAL}$  = Total package power dissipation, in Watts (W)

$V_{IN[1,2]}$  = Channel 1 and Channel 2 Input Voltage, in Volts (V), respectively

$R_{LOAD[1,2]}$  = Channel 1 and Channel 2 Output Load Resistance, in Ohms ( $\Omega$ ), respectively

$I_{OUT[1,2]}$  = Channel 1 and Channel 2 output current, in Amps (A), respectively

$V_{OUT[1,2]}$  = Channel 1 and Channel 2 output voltage, or  $R_{LOAD[1,2]} \times I_{OUT[1,2]}$ , respectively

### Power Dissipation Derating Curve

Note: Each  $V_{IN}$ ,  $V_{OUT}$  = 1 in<sup>2</sup> 1.2 oz. copper on FR4
